

In the Claims

Please amend the claims as follows:

1 1. (Currently Amended) A method of in circuit emulation of an
2 integrated circuit including a digital data processor capable of
3 executing program instructions, comprising the steps of:

4 detecting a first debug event during normal program execution;
5 upon detection of the first debug event suspending normal
6 program execution ~~except for~~ while permitting at least one type
7 interrupt service routine executed in response to a corresponding
8 interrupt;

9 incrementing a debug frame counter upon each of the at least
10 one type interrupt received while suspending normal program
11 execution;

12 decrementing the debug frame counter upon each return from
13 interrupt received while suspending normal program execution; and

14 detecting at least one second debug event during an interrupt
15 service routine executing while suspending normal program execution;

16 upon detection of the second debug event suspending program
17 execution of the interrupt service routine while permitting
18 execution of other interrupt service routines in response to
19 corresponding interrupts; and

20 storing the count of said debug frame counter upon each second
21 debug event.

1 2. (Original) The method of claim 1, wherein said integrated
2 circuit includes a plurality of debug event detectors, and wherein:

3 said step of detecting a first debug event occurs at a first
4 one of the plurality of debug event detectors;

5 said step of detecting a second debug event occurs at a second
6 one of the plurality of debug event detectors; and

7 said step of storing the count of said debug frame counter
8 occurs at said second one of the plurality of debug event detectors.

1 3. (Original) The method of claim 2, further comprising:
2 determining an order of interrupts triggering second debug
3 events by reading said stored count of said debug frame counter from
4 each of said debug event detectors.

1 4. (New) The method of claim 2, further comprising:
2 limiting each of said debug event detectors to triggering a
3 single debug event before being cleared.

1 5. (New) The method of claim 4, wherein:
2 said limiting step includes
3 upon detecting a debug event at each debug event detector
4 checking the stored count of the debug frame counter, and
5 prohibiting triggering a debug event if the stored count
6 of the debug frame counter is nonzero.

1 6. (New) The method of claim 1, further comprising:
2 resetting the debug frame counter upon return to normal
3 program execution.

1 7. (New) The method of claim 1, further comprising:
2 resetting the debug frame counter upon an abort interrupt
3 corresponding to an unrecoverable error during an interrupt service
4 routine.
